1. Executive Overview

La Fruiterie Globale's business domain is the fruit and vegetable grocery store industry. Our client is Reeba Shad, she is the owner's daughter. Our client needs a better way to manage their inventory as they have a large extensive inventory with many different categories of items and as of right now their current way of monitoring and keeping track of their stock is extremely inefficient and tedious. For this deliverable we switched clients with another group and we worked on the front end and overall UI/UX and then asked for feedback from the client so we can satisfy their needs.

Appendix 1 is a series of revised user stories and tests that are straight from the client and what they think of the user interface. Discuss what needs to be changed, removed, or added.

Appendix 2 is about revising and making any necessary changes to the story map. We also noted what has been changed.

2. Revised Summary Narrative

From the moment we started working on the user interface for this deliverable until now, there have been no new changes or additions to the project's summary narrative. The inventory is checked by the employee. The employee keeps a list of what needs to be ordered in the evening. They update the list during the day. They then tell the owner what needs to be ordered in the evening.

For example the employee tells the owner that milk was one of the products that was sold the most. Then the owner will check the inventory of milk and will decide if he needs to place an order. If the owner decided to place an order. He will call their supplier to place an order to have the products delivered. Then their supplier will deliver it to them. Once the product is delivered to the store the employee checks if the quantity is right and checks the expiry date. If the products are expired the owner contacts the supplier and the products are returned and replaced. If the supplier doesn't deliver products on time the owner calls the supplier for updates, but nothing else can be done. Our client told us that they can't do much.

The employee is also responsible to inform the owner if a product is being sold more. In order for the owner to decide if he will order more of that product the next time he orders the product. It is also the same if a product is not as popular as it used to be. The employee is responsible to notice and tell the owner. Then the owner decided to order less of that product.

3. Business problem

The business problem that our client is looking to solve is an improvement on managing the very large inventory of a smaller grocery store. Grocery stores, regardless of their size, sell plenty of items that make it very difficult in order to manage inventory and organize themselves to know which products they need to restock on. Having a visual web application that allows them to keep track of all their products with just a few clicks will greatly improve their efficiency when it comes to knowing their current product selection and stock amounts.

4. Usability guidelines

1. User Control & Freedom

- Explanation: Users can login into dedicated accounts to see and manage inventory through a secure manner.
- In our system: Employees and owners can authenticate themselves and be able to access and manage their actions based on their dedicated roles.

2. Visibility of system status

- Explanation: Our system will keep users up-to-date on how much inventory they have and if it's getting low with alerts.
- In our system: We have a status column that has a color coded message to get the attention of the user when the stock is high(green) or low(orange), allowing the user to be fully aware about the item's stock status.

3. Internationalization

- Explanation: Users should be able to understand the data presented in front of them with the language they are the most comfortable with. There should be no language barriers.
- In our system: As requested by the client and what was presented to us in the documentation; users can toggle between French and English to change the language of the page. This language stays consistent across all other pages.

4. Reports

- Explanation: A digital and printable version of the inventory information.
- In our system: The owners can switch to the reports tab at the top to generate a downloadable and printable pdf document of their inventory stock information.

5. Recognition over recall

- Explanation: Filtering different items by their designated categories.
- In our system: Other than searching for an item by its string content, there is a dropdown list containing different selectable categories. This will show all items that belong to that selected category.

6. Different User Privileges

- Explanation: Depending on what your user role is, a user can have different data manipulation privileges.
- In our system: Users who are logged in as owners have full control over CRUD operations on inventory, meanwhile employees can only read and edit inventory.

7. Search specific items

- Explanation: Find items in your inventory by searching for it in a search bar.
- In our system: Users can put in string "terms" inside a search bar and this will automatically display the items that match these terms.

8. Simplistic design

- Explanation: A simple user friendly interface that is clean and doesn't contain unnecessary clutter so the user can stay focused on essential tasks.
- In our system: Our inventory system is designed with a clean and simple interface so that users with minimal computer skills, such as the client's parents and employees, can easily navigate and manage products without confusion.

9. CRUD operations

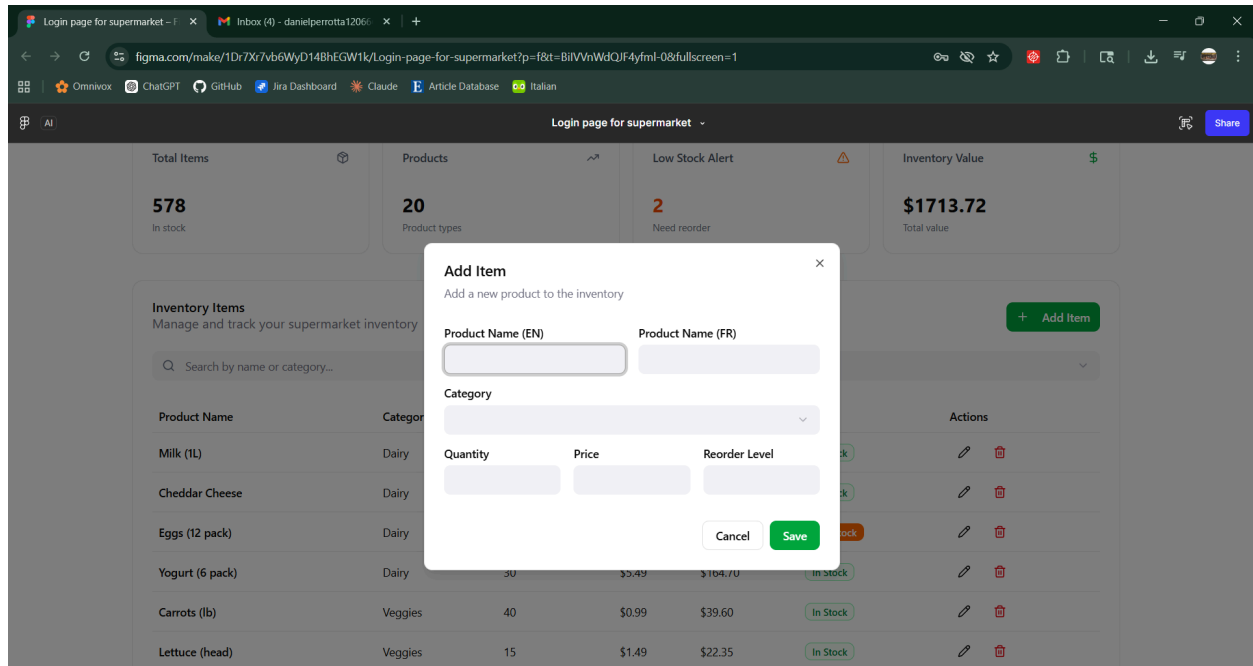

- Explanation: A user can manipulate data through creating, updating, reading or deleting.
- In our system: Owners can create, update, and delete products in the inventory, allowing them to fully control and manage the system based on their needs. Employees can help manage by only editing and seeing what's in stock.

10. Error prevention

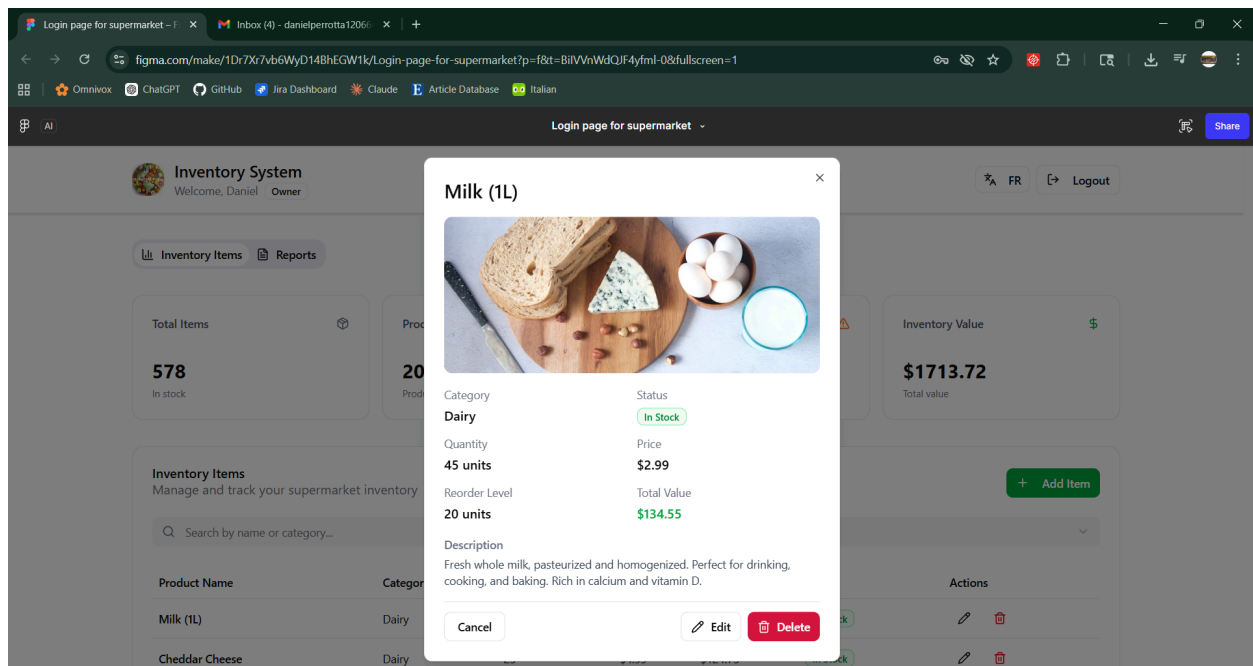

- Explanation: Systems should be designed to prevent errors before they occur rather than just reacting to them.
- In our system: The application helps prevent errors by allowing controlled updates to product information such as stock counts and prices, reducing the chances of incorrect inventory data being entered. (i.e. Negative amounts)

5. Prototype Interfaces

Owner View:

The screenshot shows a web browser displaying the 'Inventory System' dashboard for an owner named Daniel. The dashboard includes a header with the system name, a welcome message, and a 'Logout' button. Below the header, there are two tabs: 'Inventory Items' (selected) and 'Reports'. The main content area features four summary cards: 'Total Items' (578, In stock), 'Products' (20, Product types), 'Low Stock Alert' (2, Need reorder), and 'Inventory Value' (\$1713.72, Total value). Below these cards is a section titled 'Inventory Items' with a description 'Manage and track your supermarket inventory' and an 'Add Item' button. This section includes a search bar and a dropdown menu for 'All Categories'. A table lists the inventory items with columns for Product Name, Category, Quantity, Price, Value, Status, and Actions.

Product Name	Category	Quantity	Price	Value	Status	Actions
Milk (1L)	Dairy	45	\$2.99	\$134.55	In Stock	Edit Delete
Cheddar Cheese	Dairy	25	\$4.99	\$124.75	In Stock	Edit Delete

6. Client's comments

We scheduled a *Google Meet* with the client on Thursday, March 26 2026. During the meeting with Reeba, we showed her the prototype interfaces seen in the previous page. She had no complaints or issues with it, she said “it looks good” and we even asked her at the end for any feedback, she had nothing to say but to tell us that we did a good job. An email containing screenshots was also sent to her so that she can show her family so we could perhaps get feedback from them, but she hasn't emailed us saying otherwise. Overall the client was satisfied with the UI and didn't ask for changes to the system either.

7. Prototype Changes

As mentioned in the previous section, the client was completely satisfied with the UI and didn't have issues or changes to suggest to us. Here is the figma link:

<https://www.figma.com/make/cOXGyYCxFuUcpiYxN3WhOh/Login-page-for-supermarket?p=f&t=0dmx0YtYRYFWdJwv-0>

8. Appendix 1

The User Story has changed a bit, we didn't include the Over Stock and Profit Stories into our UI Prototype, but no new user stories have been added.

Old User Stories:

Employee user stories

Title: Update inventory
User Story: <u>As an</u> Employee <u>I want to</u> update the inventory information (price, count, expiration) in the evening <u>so that</u> we know how much inventory of a product is left.

Owner user stories

Title: Product Counts
User Story: <u>As a</u> store owner <u>I want to</u> be able increase/decrease the product count throughout the day <u>so that</u> I have an accurate product count at all times.

Title: CRUD Operations
User Story: <u>As a</u> store owner <u>I want to</u> be able add/delete a product <u>so that</u> I can manage what products our store still sells or not.

Title: Low Stock
User Story: <u>As a</u> store owner <u>I want</u> pop up notification alerts to know when to buy products before they are all sold out <u>so</u> that I don't lose customers.

Title: Over Stock
User Story: <u>As a</u> store owner <u>I want</u> pop up notification alerts to know when products are over stocked <u>so</u> I don't lose money and waste food.

Title: Profit

User Story: As a store owner I want to know how much of each product was sold in a day so that I know how much profit I made.

Title: Viewing Report

User Story: As a store owner I want a digital version of the inventory information so that I have a record of the information digitally.

Title: Printing Report

User Story: As a store owner I want a printable version of the inventory information so that I have a record of the information on paper.

User stories For both**Title: Log In**

User Story: As a store owner or employee I want to be able to enter my username and password so I can log in to the application.

Title: Filter

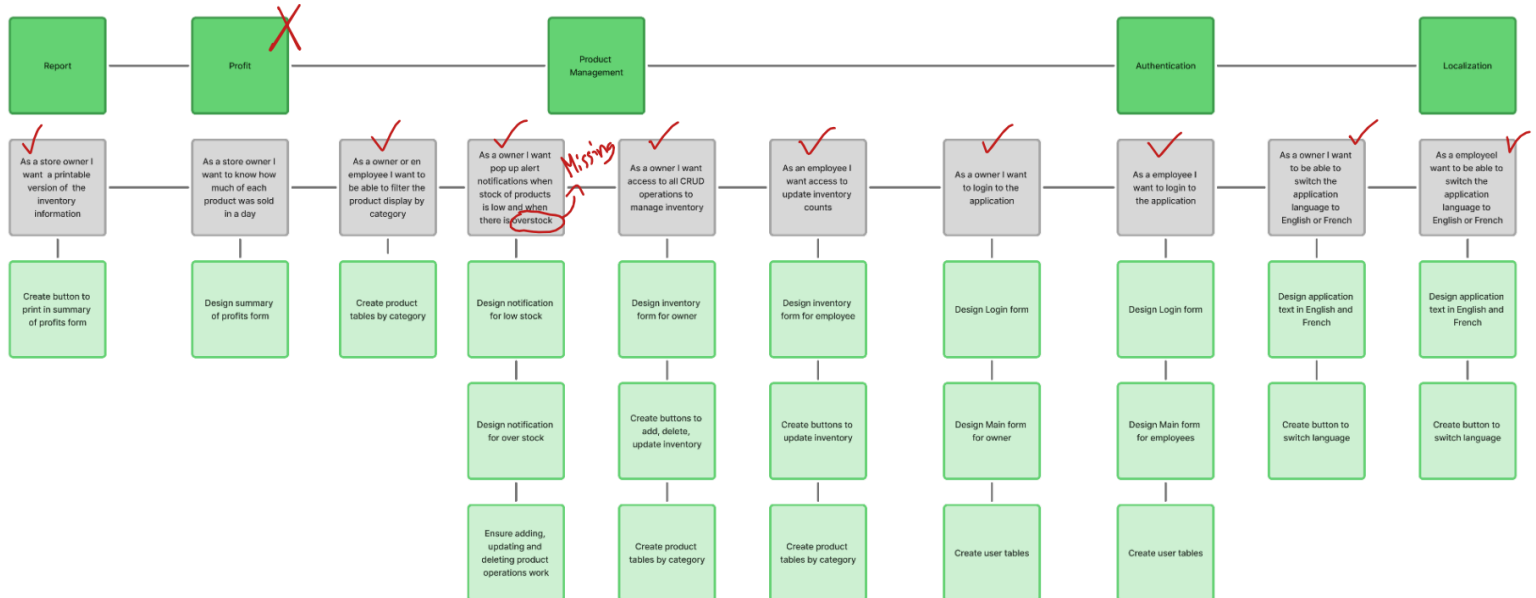

User Story: As a store owner or employee I want to be able to filter the product display by category so I can view products from each category.

Title: Localization

User Story: As a store owner or employee I want to be able to switch the application language to English or French so I can correctly understand the information.

9. Appendix 2

As mentioned in Appendix 1, the only things that have not been implemented are the Overstock and The Profit, so in the Story Map below anything with a check mark remains the same.

10. Team Logbook

Meeting Number	Participants	What was discussed?	Where?	Work done	Duration (date and minutes)
1	Cyril, Daniel, Fairoz	- How should the UI look for the green team? - What are the requirements needed for the green team's client?	D-241	- Worked on the login and main page of the ui on figma - Early sketches of each page for project's UI	Wednesday, March 18, 2026 115 minutes
2	Cyril, Daniel, Fairoz, Karim	- Set up a meeting with other team's client	D-244	- Finished prototype UI - Meeting scheduled with Reeba	Tuesday, March 24 2026 90 minutes
3	Cyril, Daniel, Fairoz, Karim	- Showed prototype to green team's client - Asked for feedback or changes	Online (Google Meet)	- She had no complaints - Sent her screenshots to show her parents/family	Thursday, March 26 2026 11 minutes
4	Cyril, Daniel, Fairoz, Karim	- Karim and Daniel rehearsed on what they will say during the presentation	D-243	- Added overstock alerts and daily item profit	Monday, March 30, 2026 150 minutes
